

## Overview

When building queries, list views, and reports, it's best to create filter conditions that are selective so Force.com scans only the rows necessary in the objects your queries target—the Force.com query optimizer doesn't use an index to drive queries containing unselective filter conditions, even if the fields those filter conditions reference already have indexes on them. (This cheat sheet's "Index Selectivity Exceptions" section points to several things that automatically make filter conditions unselective.) Because filter conditions are also unselective if they exceed the Force.com query optimizer's thresholds, selectivity is especially important when your queries target objects containing more than one million records. Read on to learn how to write selective filter conditions, minimize your query response times, and optimize the database's overall performance.

## Fields with Database Indexes

### Indexed Standard Fields, All Objects

Id
Name
OwnerId
CreatedDate
SystemModstamp
RecordType (indexed for all standard objects that feature it)

### Master-detail fields

### Lookup fields

### Other Indexed Fields

### Unique fields

### External ID fields

## Index Selectivity Conditions and Thresholds

Condition	Thresholds	Index Used
Unary: standard index	Filter targets less than: <ul style="list-style-type: none"> <li>30% of the first million records</li> <li>15% of records after the first million records</li> <li>1 million total records</li> </ul>	Standard index
Unary: custom index	Filter targets less than: <ul style="list-style-type: none"> <li>10% of the first million records</li> <li>5% of records after the first million records</li> <li>333,333 total records</li> </ul>	Custom index
AND	Filter targets less than: <ul style="list-style-type: none"> <li>Twice the index selectivity thresholds for each filter</li> <li>The index selectivity thresholds for the intersection of the fields</li> </ul> <p>The Force.com query optimizer can detect date and number ranges, and treats their filters on the same field as a single, combined filter.</p>	Composite index
OR	Filter targets less than: <ul style="list-style-type: none"> <li>The index selectivity thresholds for each filter</li> <li>The index selectivity thresholds for the sum of those fields</li> </ul>	Index union
LIKE	For conditions that don't start with a leading wildcard, Force.com tests the first 100,000 rows for selectivity.	Standard index or custom index

## Force.com Query Optimizer - Standard Index

Total Records			
30% of 1-1M records ↑ 300,000 ceiling		+	15% of 1M+ records ↑ 700,000 ceiling
			= Final Threshold = 1M Ceiling
# of records	First Threshold	Second Threshold	Final Threshold
≤ 1 million	30% of total	n/a	30% of total
≤ 2 million	300,000	150,000	450,000
≤ 3 million	300,000	300,000	600,000
≤ 4 million	300,000	450,000	750,000
≤ 5 million	300,000	600,000	900,000
≥ 5.6 million	300,000	700,000	1 million

## Force.com Query Optimizer - Custom Index

Total Records			
10% of 1-1M records ↑ 100,000 ceiling		+	5% of 1M+ records ↑ 233,333 ceiling
			= Final Threshold = 333,333 Ceiling
# of records	First Threshold	Second Threshold	Final Threshold
≤ 1 million	10% of total	n/a	10% of total
≤ 2 million	100,000	50,000	150,000
≤ 3 million	100,000	100,000	200,000
≤ 4 million	100,000	150,000	250,000
≤ 5 million	100,000	200,000	300,000
≥ 5.6 million	100,000	333,333	333,333

## Index Selectivity Exceptions

Filter Conditions With	In SOQL	In Reports and List Views
Negative filter operators	<ul style="list-style-type: none"> <li>!=</li> <li>NOT LIKE</li> <li>EXCLUDES</li> </ul>	<ul style="list-style-type: none"> <li>not equal to</li> <li>does not contain</li> <li>excludes</li> </ul>
Comparison operators paired with text fields	<ul style="list-style-type: none"> <li>text_field &lt;</li> <li>text_field &gt;</li> <li>text_field &lt;=</li> <li>text_field &gt;=</li> </ul>	<ul style="list-style-type: none"> <li>text field less than</li> <li>text field greater than</li> <li>text field less or equal</li> <li>text field greater or equal</li> </ul>
Leading "%" wildcards	LIKE ' %string%'	contains
References to non-deterministic formula fields	Cross-object formula fields	

## SOSL

### Search Selectivity Tips

Be as selective as possible. For example, use Michael\*, not Mich\*.

Remember that Chatter feed searches aren't affected by the scope of your search, and that their results include matches across all objects.

Search for exact phrases using advanced searches.

Limit scope by targeting:

- Specific objects
- Rows owned by the searcher
- Rows within a division, when applicable

### Fields with Search Indexes (Vary by Object)

Name fields

Phone fields

Text fields

Picklist fields
