

Ways to include Visualforce pages into Lightning Platform

Comparte la información a tus amigos

Visualforce pages into Lightning Platform have several ways to be included in Salesforce. Do you want to know more about it?

When an organization has complex business processes which require unique UI and are not support by existing functionality, we can use Visualforce

pages, that’s the importance of it.

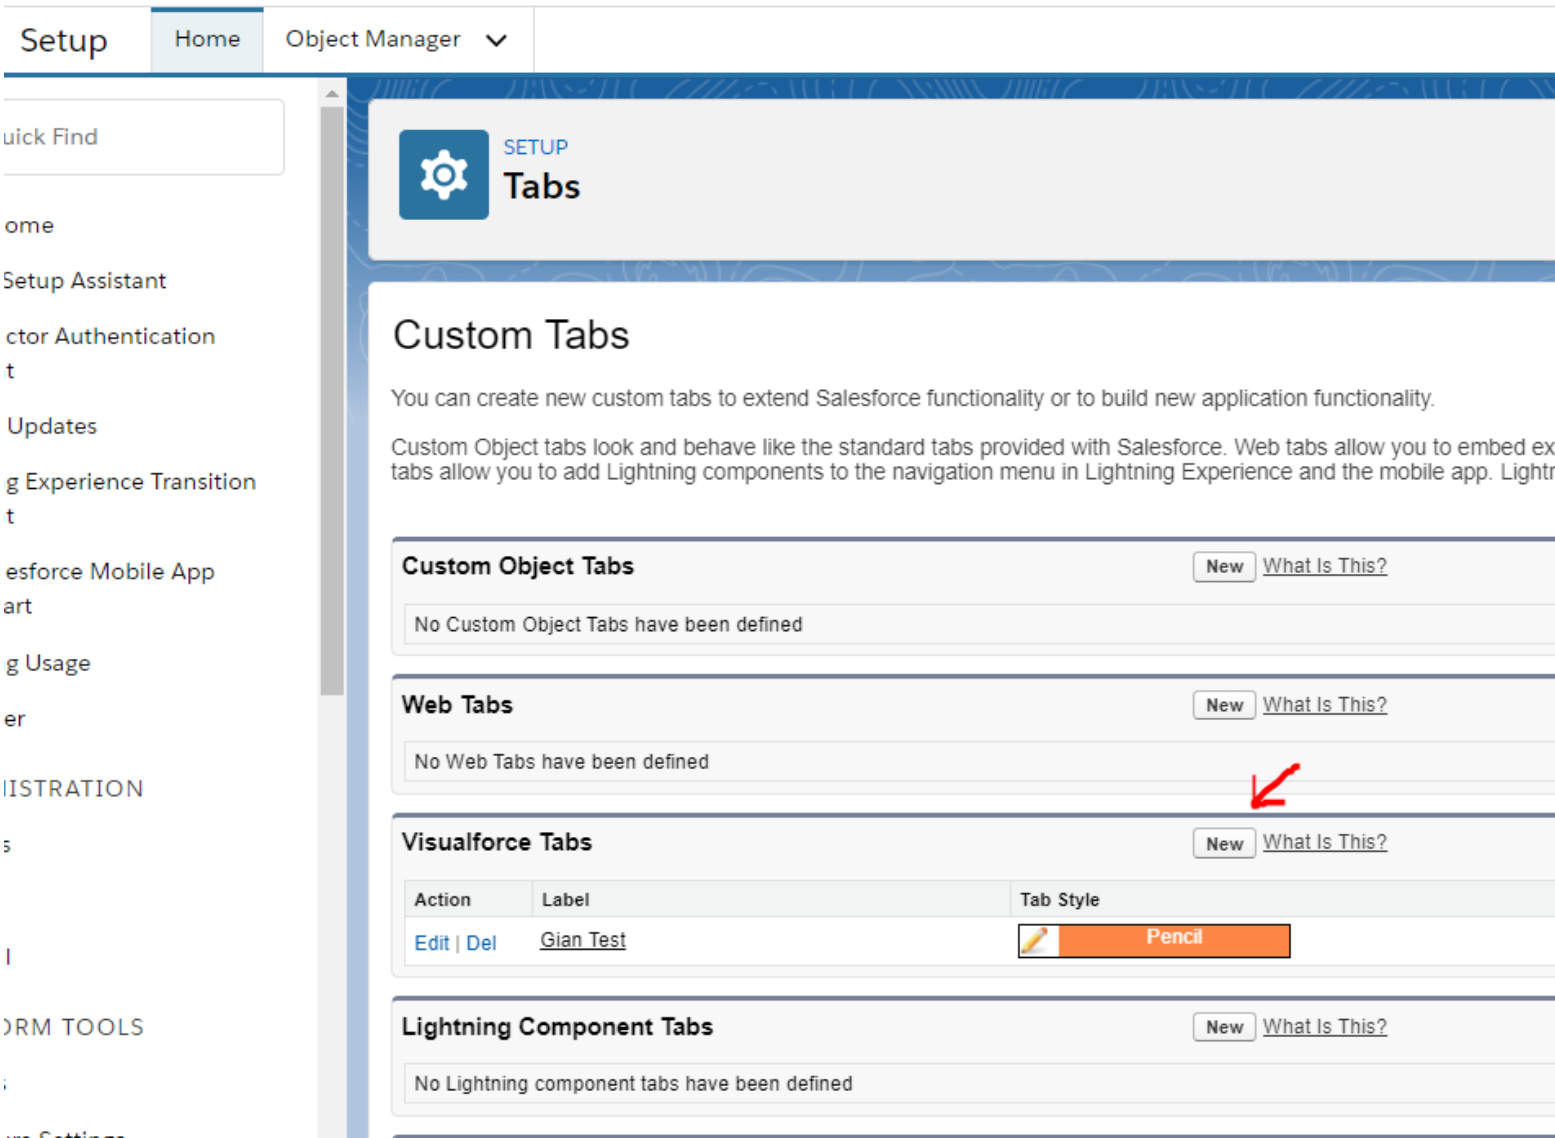

Applications of Visualforce Pages into Lightning Platform

A Visualforce Page (VFP) can be incorporated into Force.com as **tabs, home pages, page layouts, buttons, links, components, menu items, quick actions and pages.**

Tabs

When creating a **custom tab** we are allow to **embed Visualforce pages**.

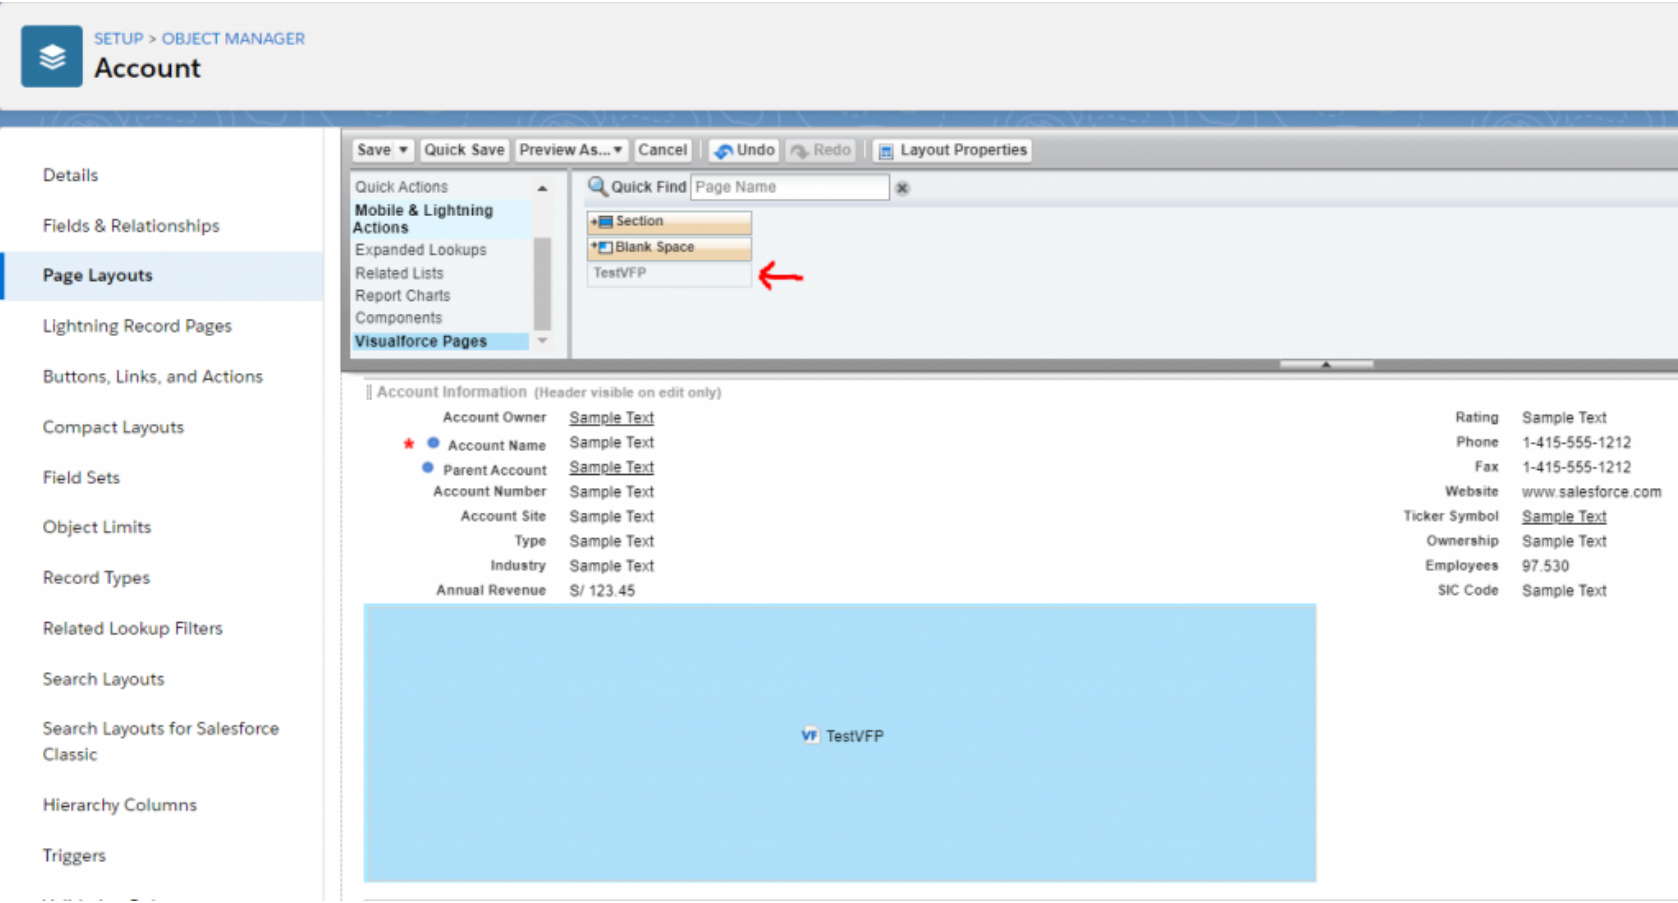

Go to **Setup** and search for “**Tabs**”. In the **Visualforce Tabs** section we are allow to create a new tab related a visualforce page.

In addition, we can **override Tab home Pages**. Overriding tabs only works when the Visualforce pages uses the **standard list controller** for that tab, that means, using **custom controllers** or **no controller**.

Page Layouts

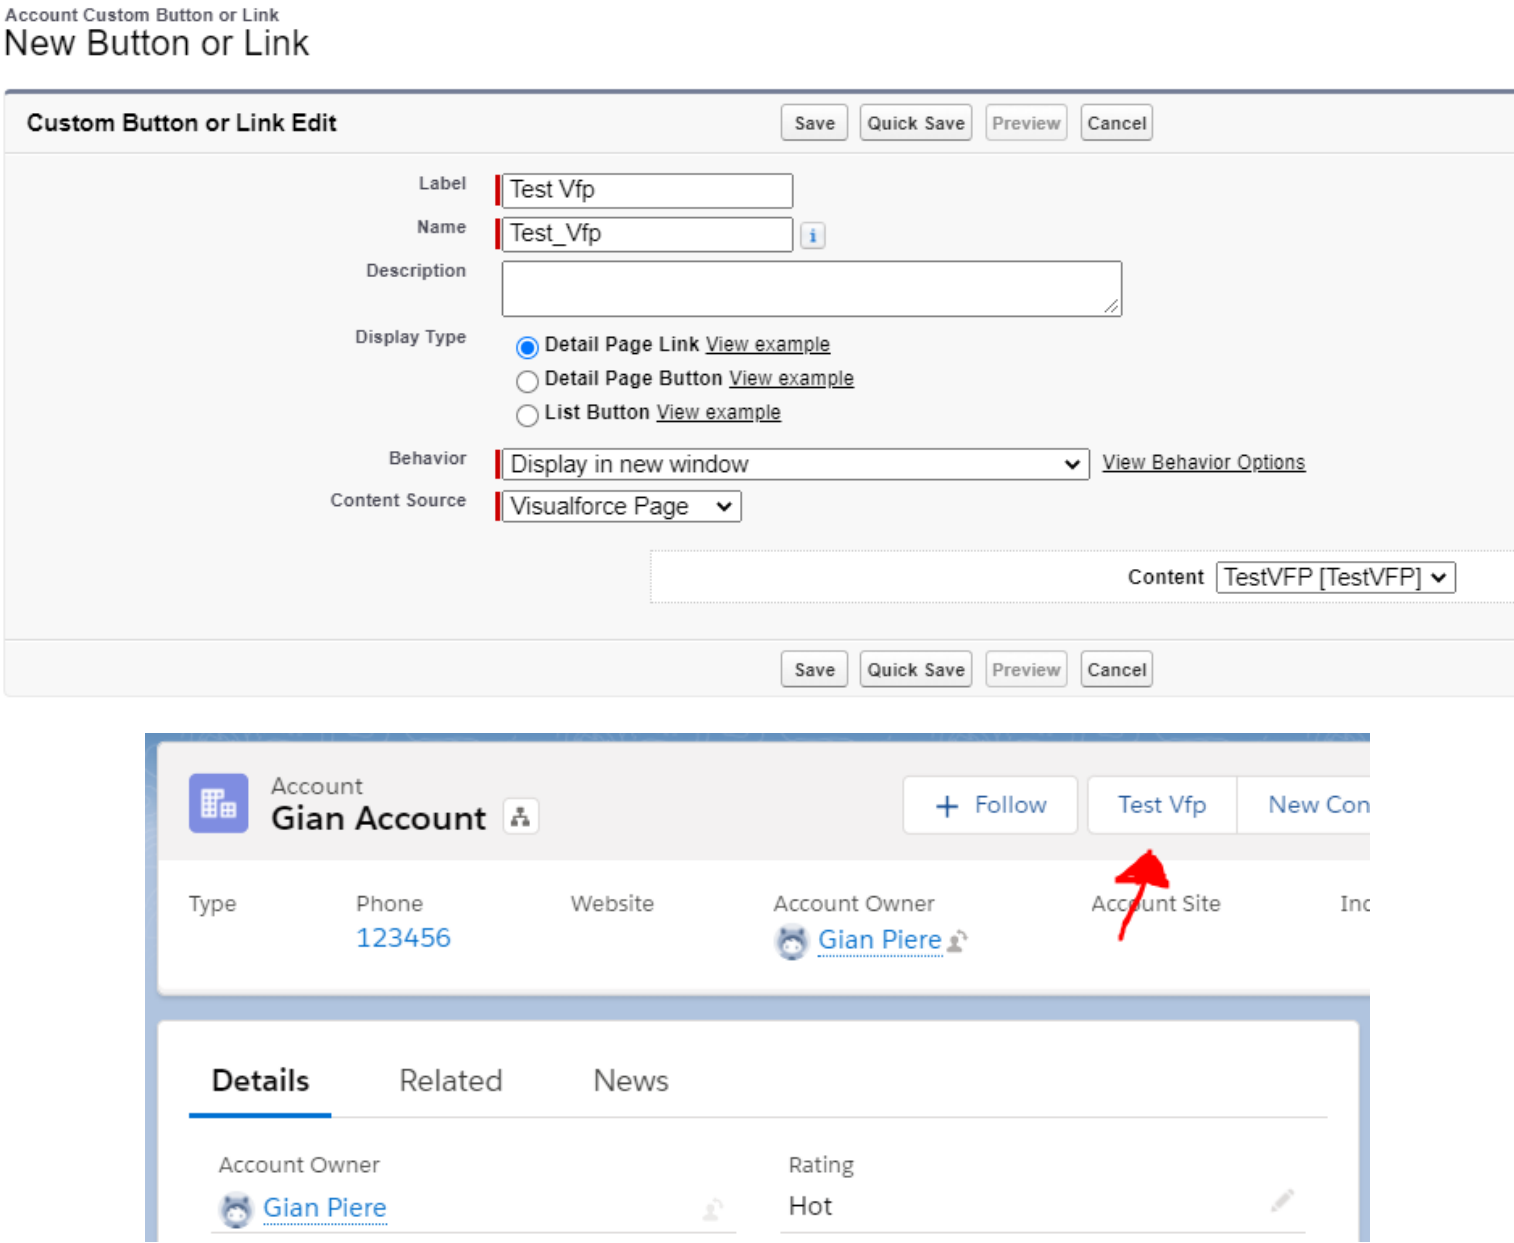

We can embed visualforce pages into page layouts. However, that VFP should use the **standard controller** of the standard or custom **object associated** with the **page layout**.

Button or Link

We can configure Buttons or links to launch Visualforce pages. Also, we can override buttons or actions in standard or custom objects.

To create a **custom button** for an standard object, go to the “**Buttons, Links and Actions**” section in the object and clic in “**New Button or Link**”, select the **visualforce page** option in **Content Source** and, finally, add it to the Object’s Layout from **Mobile & Lightning Actions**.

To replace a standard button, link or action. Go to that section in the object, select the button and clic in **Edit** and select as “override with” option your visualforce page.
