

[Performance of salesforce queries](#)

October 16, 2013 [bartoszborowiec](#) [1 comment](#)

Lets assume that you have a custom object Custom\_Object\_\_c.

and there are two queries

- 1) select id, Name from Custom\_Object\_\_c order by CreatedDate.
- 2) Select id, name from Custom\_Object\_\_c order by LastModifiedDate.

first query is definitely faster, because CratedDate is a unmodifiable field created once when object is created and there is a very efficient index on it.
